Producător cu tradiție

IACOBAȘ CONSTRUCT

La momentul actual **SC Iacobaș Construct SRL** este unul dintre cei mai mari și cunoscuți producători de articole din beton din Republica Moldova. Folosim cea mai modernă și performantă tehnologie la momentul de față la nivel internațional. Ca parteneri avem firme europene, de la care procurăm utilaj și materiale. Echipa unită, este implicată activ în proiecte noi, în dezvoltarea de noi tehnologii, pentru a crea noi produse de înaltă calitate. Datorită gamei variate de produse, SC Iacobaș Construct SRL, ocupă locul de frunte printre producătorii de articole din beton din Republica Moldova. În conformitate cu tendințele timpului am creat produse optimizate din punct de vedere al raportului preț/calitate.

Despre pavajele de la Iacobaș Construct SRL: Pavajele se adresează celor ce doresc să îmbine luxul cu utilitatea la prețuri accesibile. Aspectul estetic net superior prin suprafața lucioasă și divers colorată oferă oricărei case un plus de rafinament și bun gust. Curtea, aleile pietonale, drumurile pavate cu pavajul frumos și divers, vor da terenului un aspect complet și respectabil.

De ce sunt utile pavajele?

Se montează pe pat de nisip reducând considerabil costurile. Sunt ușor de montat, puteți face acest lucru și singuri alegând modelul pe care îl doriți. Oferă siguranță contra alunecării. Pot fi îndepărtate cu ușurință când este nevoie (ex. intervenții la conducte subterane), iar apoi se pot monta la loc fără pierderi. Asigură drenarea apei și aerisirea solului datorită rosturilor de circa 2-3mm care se formează între piese.

Sunt recomandate pentru:

Alei, terase, trotuare, drumuri, parcuri, trafic pietonal mijlociu și mare.

Instrucțiuni de montaj și întreținere:

- Se înlătură de pe suprafața ce urmează a fi pavată, un strat de 10-30cm de pământ, volumul de pământ dislocat se va înlocui cu pietriș.
- Pietrișul se distribuie pe terasament în mod egal și apoi se netezește cu o greblă, după care se va tasa cu auto compactatorul de 3-5 tone.
- Peste pietrișul compactat se pune un strat de nisip uscat (sort 3-7mm) de circa 2-4 cm și se compactează cu un vibrator cu plăcă (greutatea de serviciu de 130-160 kg).
- Suprafața pavată va avea o pantă de scurgere de 1% (1 cm diferență de nivel pe un metru). Această pantă se realizează astfel: se introduc două țevi în stratul de pietriș compactat măsurându-se exact diferența de nivel, țevile fiind suport pentru rigla de nivelare.
- Montarea pavelelor se face prin simpla așezare a acestora la configurarea dorită (după model).
- Pentru a evita alunecarea pavajului este necesar ca acesta să se încadreze între borduri de beton.
- După terminarea pavării suprafeței alese se va presăra un strat de nisip spălat și uscat, fin 0-3mm apoi se va curăța suprafața pavată prin măturare.
- Se va tasa apoi pavajul cu un vibrator de suprafață cu plăcă de cauciuc. Se va presăra din nou nisip fin în rosturi și se va curăța suprafața. Fixarea în nisip și vibrarea pavelelor se face pe timp uscat.

Întreținere

- Pavajul va fi protejat de substanțe chimice (clor, acizi, săruri).
- Pentru deszăpezire nu se vor folosi unelte sau utilaje cu lame metalice, sau sare de drumuri.
- Se va evita depășirea gabaritului recomandat de producător.

Greutăți admise pentru circulație:

1. - pietonală pentru pavajele cu o grosime de 2,2-3 cm.
2. - 2-3 tone pentru pavajele cu o grosime de 3,8 cm.
3. - 3-6 tone pentru pavajele cu o grosime de 4,5-4,7 cm. (dimensiuni mici pavaj)
4. - 6-8 tone pentru pavajele cu o grosime de 5,6-6 cm. (dimensiuni mici pavaj)
5. - 20-30 tone pentru pavajele cu o grosime de 7-8 cm

NOTĂ: Apariția petelor la pavaje, inclusiv și petele albe, care apar în urma condițiilor climatice, nu sînt defecte de producere și nu se primesc reclamații

Atenție! În procesul montării la prelucrare încheiturilor finale, se utilizează doar nisip pur, fără ciment.

NOTA INFORMATIVĂ SE REFERĂ LA TOATE ARTICULELE DIN BETON

EFORESCENȚA (PETELE ALBICIOASE SAU BRUNE) problemă de aspect nu de rezistență

ESTE UN FENOMEN NATURAL ȘI NU REPREZINTĂ UN DEFECT

Eflorescența apare la produsele cu un conținut ridicat de ciment și este rezultatul interacțiunii dintre hidroxi-dul de calciu ($\text{Ca}(\text{OH})_2$) din pasta de ciment folosită la producerea pavajului și CO_2 din atmosferă, care se depune sub formă de pete (zone albicioase sau brune la elementele de beton cu pigmenți) pe suprafața plăcilor de pavaj.

Eflorescența nu afectează rezistența pavajelor și dispare în timp.

Fenomenul de eflorescență dispăre cu trecerea timpului, însă poate fi înlăturat și mai înainte folosind produse de curățare specifice.

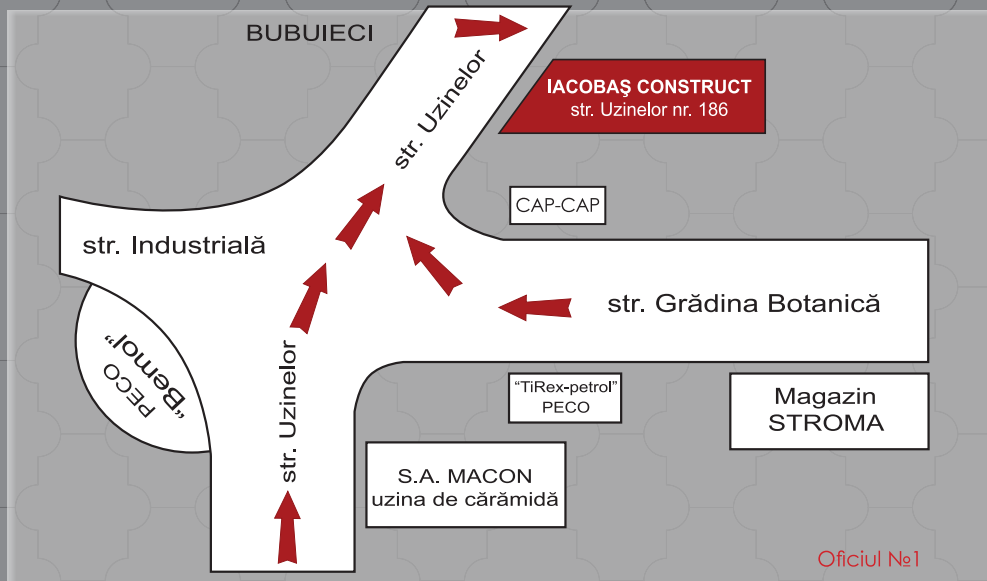

Eflorescențele sunt un FENOMEN NATURAL ABSOLUT IMPREVIZIBIL

Pentru prevenirea sau limitarea eflorescențelor poate fi folosit Fluosilicatul de zinc (ZnSiF_6) - care prin reacție cu cristalele de hidroxid de calciu formează fluorura de calciu insolubilă, cu creșterea impermeabilității și rezistenței suprafețelor de beton tratate.
